

Product Requirement Document

Product Name

Online Food Ordering System

Problem Statement

Existing food ordering methods are often inefficient, lack real-time tracking, and offer limited menu browsing options, leading to user frustration and inaccurate orders.

Goals

- Enable users to easily browse menus from various restaurants.
- Allow users to place food orders conveniently and securely.
- Provide real-time tracking of food delivery status.
- Improve the overall user experience of ordering food online.

User Personas

- Hungry Customer: Wants to order food quickly, browse options, and track delivery.
- Restaurant Owner/Manager: Needs to manage menus, orders, and receive payments efficiently.
- Delivery Driver: Needs to receive delivery assignments, navigate efficiently, and update delivery status.

Functional Requirements

- User registration and authentication (customer, restaurant, driver).
- Browse restaurants and their menus with search and filter options.
- Add/remove items from a shopping cart.
- Place and manage food orders.
- Secure payment processing integration (credit card, digital wallets).
- View order history and status updates.

- Real-time GPS-based delivery tracking for customers.
- Restaurant dashboard for menu management, order acceptance, and order status updates.
- Driver application for receiving orders, route optimization, and updating delivery status.
- Rating and review system for restaurants and drivers.

Non Functional Requirements

- **Performance**: The system must be fast and responsive, handling high concurrent user loads.
- **Security**: All user data, payment information, and transactions must be securely protected and compliant with relevant regulations.
- **Usability**: The user interface should be intuitive, easy to navigate, and accessible across different devices.
- **Reliability**: The system should maintain high availability (e.g., 99.9% uptime) with robust error handling.
- **Scalability**: The architecture must support future growth in users, restaurants, and order volume.
- **Maintainability**: The codebase should be well-documented, modular, and easy to update and extend.

Constraints

- Must comply with data privacy regulations (e.g., GDPR, CCPA).
- Integration with at least two major third-party payment gateways.
- Development must adhere to a strict budget and timeline.
- Dependence on reliable third-party mapping and GPS services for real-time tracking.
- Compatibility with major mobile operating systems (iOS and Android).

Assumptions

- Users have stable internet access and compatible mobile devices.
- Restaurants are willing to onboard and actively manage their presence on the platform.
- A sufficient pool of delivery drivers is available and willing to use the driver application.

- Third-party payment gateways and mapping services maintain their APIs and service levels.
- Legal and regulatory environment regarding food delivery and gig economy remains stable.

Out Of Scope

- Loyalty programs or advanced reward systems for customers.
- In-app customer support chat (initial focus on FAQ and external support).
- Advanced business intelligence dashboards for restaurants (beyond basic reporting).
- Subscription models for premium features for users or restaurants.
- Internationalization/Multi-language support (initially targeting a single language and region).
- Integration with point-of-sale (POS) systems within restaurants.
